

ABSTRACT

5 The present invention relates to a process for printing active materials, such as adhesives,
onto articles, such as absorbent articles or release paper, using a coater with a multitude of
applicators, which coats a surface (roll) with a multitude of beads of the active material; the
process also uses a specific coating blade, which contact the surface with eh active material with a
certain angel and coats thereby the surface even better; preferred is also a specific second surface
10 (roll) arrangement. The invention also relates to articles obtainable by such a process and
equipment specifically designed for the process.
